Tuberculosis Treatment

The present invention relates to tuberculosis treatment, such as treatment of diseases mediated by *Mycobacterium*, e.g. *Mycobacterium tuberculosis*, with pleuromutilins.

5 Tuberculosis is a chronic infectious disease mediated by infection with *Mycobacterium tuberculosis*. Tuberculosis is a major disease in developing countries, as well as an increasing problem in developed areas of the world. Although the infection may be asymptomatic for a considerable period of time, the disease is most commonly manifested as an acute inflammation of the lungs, resulting in fever and a nonproductive cough. If
10 untreated, serious complications and death typically result. Tuberculosis may be generally controlled by antibiotic therapy, such as by treatment with Isoniazid, see e.g. The Merck Index, 12th edition, item 5203; Rifampin (Rifampicin®), see e.g. The Merck Index, 12th edition, item 8382, Streptomycin, see e.g. The Merck Index, 12th edition, item 8983; but a major problem is the development of strain drug resistance against such antibiotics.

15 We have now found a compound class which shows surprisingly activity in the treatment of diseases caused by *Mycobacterium*, such as *Mycobacterium tuberculosis*, e.g. even against drug resistant strains.

20 In one aspect the present invention provides the use of a pleuromutilin in the preparation of a medicament for the treatment of diseases mediated by *Mycobacterium*.

25 In another aspect the present invention provides a method of treating diseases mediated by *Mycobacterium*, comprising administering to a subject in need of such treatment an effective, e.g. an anti-mycobacterium effective; amount of a pleuromutilin.

30 *Mycobacterium* includes *M. tuberculosis*. Diseases mediated by *Mycobacterium* include mycobacterium infections. A pleuromutilin for treatment includes one or more pleuromutilins, e.g. a combination of different pleuromutilins. Treatment includes treatment and prophylaxis. A pleuromutilin for use according to the present invention or for treating diseases according to the present invention is designated hereinafter as "a pleuromutilin(s) of (according to) the present invention".

A pleuromutilin of the present invention includes a pleuromutilin in the form of a free base, and, where existing, in the form of a salt, in the form of a solvate and in the form of a salt and a solvate, e.g. and in the form of a complex, such as a cyclodextrin complex.

A pleuromutilin of the present invention may exist in the form of isomers and mixtures

- 5 thereof, e.g. including diastereoisomers and mixtures thereof. Isomeric mixtures may be separated as appropriate, e.g. according to a method as conventional, to obtain pure isomers. The present invention includes a pleuromutilin according to the present invention in any isomeric form and in any isomeric mixture, such as described in patent literature cited
- 10 below, which patent literature is introduced herein by reference with respect to isomeric forms of pleuromutlins. Preferably the cofiguration in the mutilin ring is the same as in a naturally produced mutilin.

Pleuromutilin, a compound of formula

- 15 is a naturally occurring antibiotic, e.g. produced by the basidiomycetes *Pleurotus mutilus* and *P.passeckerianus*, see e.g. The Merck Index, 12th edition, item 7694. A number of further pleuromutilins having the principle ring structure of pleuromutilin and having e.g. antibacterial activity, have been developed.

- 20 A pleuromutilin of the present invention includes a pleuromutilin having the basic structural elements as set out in formula

wherein R is vinyl or ethyl and the dotted line is a bond or is no bond.

The following numbering system is used in the present application:

The dotted line between positions 19 and 20 (and between positions 1 and 2) is a bond or is no bond. In a compound of formula A or of formula PLEU a hydrogen atom in positions 4, 7 and/or 8 of the ring system may be replaced by deuterium, and if the dotted line between positions 1 and 2 is no bond (single bond between positions 1 and 2) the ring system may be further substituted in positions 1 and/or 2, e.g. by halogen, deuterium or hydroxy. The group -O- in position 14 is further substituted, preferably by a substituted carbonyl group.

Activity against strains of *Mycobacterium*, e.g. *M.tuberculosis* may be determined according to the following General Test Procedure:

General Test procedure

Is carried out according to the known and appropriate Agar Dilution Test.

Agar is used as a substrate. Shortly before solidification of the Agar TEST COMPOUNDS in different concentrations are added and mixed into the still liquid agar mass (according to the Agar dilution test). Controls without TEST COMPOUNDS are also prepared for determination of strain growth ability. The thus prepared agars are inoculated after solidification with *Mycobacterium tuberculosis* strains. Incubation is carried out in normal incubators at 37°C. As a nutrition medium Middlebrook 7H10 + OADC (Oleic, Albumin, Dextrose, Catalase) Enrichment (pH 6.71- 6.73) is used.

The minimum inhibition concentration (MIC) which is the compound concentration in the agar which inhibits 99% of strain growth, is determined after 3 weeks, 4 weeks and 5 weeks after inoculation.

Pleuromutilins of the present invention show activity against strains of *Mycobacterium*, e.g. *M.tuberculosis* and are thus useful in the treatment of infections caused by *Mycobacterium*. Pleuromutilins of the present invention surprisingly are even active against resistant and multiresistant *M.tuberculosis* strains, e.g. strains which are resistant against treatment with known pharmaceuticals useful in the treatment of tuberculosis, e.g. Isoniacid, Rifampicin, Streptomycin.

TC-10/2	2	16	4

In TABLES B to E in the column "TC/week" the term "TC-number" indicates the TEST COMPOUND as defined above, e.g. TC-1 indicates a compound of formula I-Tiamulin; and "/week" indicates the MIC-determination point (in weeks from inoculation) in the testing of such TEST COMPOUND. "TC-1/3" for example indicates that the MIC of a compound of formula I-Tiamulin was determined after 3 weeks from inoculation.

10

MIC is the minimum inhibition concentration as defined above. The strain numbers 1 to 4 and 6 to 7 indicated in TABLE B, the strain numbers 1 to 9 indicated in TABLE C and the strain numbers 10 to 15 indicated in TABLE D, and the strain numbers 1, 12 and 15 indicated in TABEL E refer to the corresponding *Mycobacterium tuberculosis* strains of

5 Example A.

Furthermore compounds of formula I_{EX} and compounds of formula I'_{EX} wherein R_{EX} is as defined in TABLE 6 below have also proved to show activity against strains 1, 12 and 15 (all compounds tested in the form of hydrochlorides):
